

# Dynamic Login Pages Overview

## Introduction

- RADIUSdesk includes an applet called Login Pages which makes it easy to manage the login pages of captive portals.
- We currently support **CoovaChilli** and **Mikrotik** based Captive Portals.
- Over the past 7+ years we used **Webix** based login pages.
- Although they served us well until now we decided to move to **Bootstrap 5** based login pages for the following reasons.
  - Bootstrap is under active development (Current version is version 5) and has a beautiful look and feel.
  - Bootstrap is well known to many developers which should make it easy for them to tweak a Bootstrap based login page and adapt to their environment should the need arise.
- The Webix based login pages is still available however and can be used although new development and features will be focused around the Bootstrap 5 based login pages.

## Components of a Login Page

- Each login page will have the following three items
  - Top Toolbar
  - Image(s)

- Login Screen
- Lets discuss these items further each under its own sectional heading.

## Top Toolbar

- The content and appearance of the top toolbar depends on the settings of the Login Page.
- The Top Toolbar can contain the following
  - A **Connect** link which causes the Login Screen to show.
  - A Title for the page. This item is configurable.
  - Login Pages that is configured to support multiple languages will include a menu item to select a different language.

## Images

- The Login Page will show at least one image.
- The image as well as the presentation of the image is all configurable when you edit the Login Page.

## Login Screen

- The Login Screen is a Pop-Up window who's contend and behavior depends on the settings of the Login Page and will be covered in detail on its own dedicated wiki page.
